

## Soumyadeep Das

This chart shows how well each algorithm does in comparison to A\* (the gold standard for graph searching). The times are divided by how long A\* took in that scenario to normalize the data points.

This chart shows the length of the path generated by the algorithm in comparison to A\* (which finds the most optimal path in our case). The lengths are divided by the cost of A\* and there are no units, since they are just points saved on a computer, and cannot be measured.
